Air Applications

Drones or Unmanned Aerial Vehicles

- Movement is uniform and independent of its application
- Does rarely apply application specific forces on its environment
- The application, navigation and control relies fully on perception

Unmanned Ground Vehicles

Observations

Education

Research

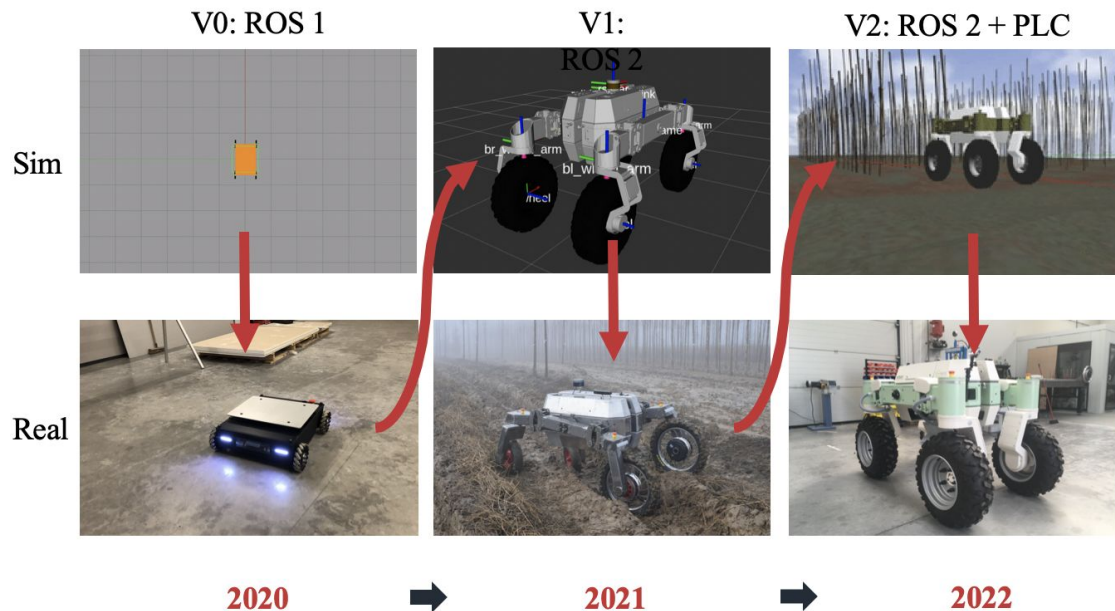

Unmanned Ground Vehicles

- Movement is not uniform and could depend of its application
- Does apply application specific forces on its environment
- The application, navigation and control relies on perception, task and total dynamics

Unmanned Ground Vehicles

- Limitations of simulation
- Real world validation is needed
- Robot needs to adapt to environment and not the other way around
